In probability theory and statistics, the exponential distribution (also known as the negative exponential distribution) is the probability distribution that describes the time between events in a Poisson point process, i.e., a process in which events occur continuously and independently at a constant average rate. It is a particular case of the gamma distribution.

in which the argument  $x$  occurs as an exponent. A function of the form  $f(x) = ce^{-cx}$ , where  $c$  is a constant, is also considered an exponential function and can be rewritten as  $f(x) = e^{-cx}$ , with  $c = ce$ . As functions of a real variable, exponential functions are uniquely characterized by the fact that the growth rate of such a function (that is, its derivative) is directly proportional to the value of the function.

Let's finish solving the problem  $5^{2x} - 3 = 18$  from before. In this problem we have already seen that it is impossible to rewrite the numbers 5 and 18 using the same base, so we must use logarithms.

In this section we will introduce exponential functions. We will be taking a look at some of the basic properties and graphs of exponential functions. We will also discuss what many people consider to be the exponential function,  $f(x) = e^x$ .

Background: The exponential function,  $Y=c \cdot \text{EXP}(b \cdot x)$ , is useful for fitting some non-linear single-bulge data patterns. In Excel, you can create an XY (Scatter) chart and add a best-fit

Section 6-3 : Solving Exponential Equations. Now that we've seen the definitions of exponential and logarithm functions we need to start thinking about how to solve equations involving them.

Every twelve to eighteen months, computers double their capabilities, and so do the information technologies that use them. Governments and the largest companies in the world use Ray Kurzweil's historical trends of exponential growth charts for predicting the future.. The chart to the left shows the improvement level that our technology will have during the next five years.
